

Service intent translation TMF641v5

Description

TM Forum RDF ontologies for intent-based automation constrain what is a valid intent expression or specification. By having the ontologies as the model to which intents must comply, intent handlers and managers leverage a single source of meaning to interpret what is expressed by the intents. As intent-based automation becomes part of Ericsson products, the process of writing intents and intent specifications connected to service/product catalogs becomes a stepping stone for realizing intent-based orchestration. Guaranteeing that only valid intents are produced is a time-consuming and error-prone task. Here, we adopt an Agentic AI solution to automate this process and define mechanisms to mitigate hallucinations and ensure compliance with TMF ontologies. This work is in collaboration with Ericsson Research (Jean Martins).
